KTR for Pumps and Compressors

Drive technology
Cooling systems

www.ktr.com

KTR – all the best for your pump.

No matter how big or small a pump is, no matter where it is used, and no matter whether it transports fluid or gaseous media, one thing is the same with all pumps: they are one of the biggest cost drivers in the industry.

If you want to have a significant influence on this, KTR is the ideal partner. We have developed couplings specifically for pump drives, allowing you to reduce operating costs due to an extended life of the pump. Our Power Transmission Center, a modern R & D centre comprising a multifunctional assembly hall, plays a major role in this development. In this centre alone, engineers have more than 25 hydraulic and electric test benches at their disposal on which extensive durability and load tests are carried out. With the result that you can be absolutely certain: a KTR coupling does what it promises.

Wherever movement is needed, we push on.

Always a good connection: KTR has been in the business of effective power transmission for over 50 years. Today, we are a leading manufacturer of high-quality power transmission technology, braking systems, cooling systems and hydraulic components. And a trustworthy partner for anyone wanting reliable and durable propulsion for their pumps and compressors.

KTR started in 1959 with one simple question: can the established curved tooth coupling be developed further? The answer was obvious, the result revolutionary – the BoWex[®], the maintenance-free coupling which combined nylon and steel for the first time. Shortly afterwards, our engineers developed the ROTEX[®], a jaw coupling which became the generic term and later even found its way into the DIN standard. From that point on, the path was mapped out. Today, KTR offers a virtually unlimited product range of well over 20,000 different couplings and other drive elements.

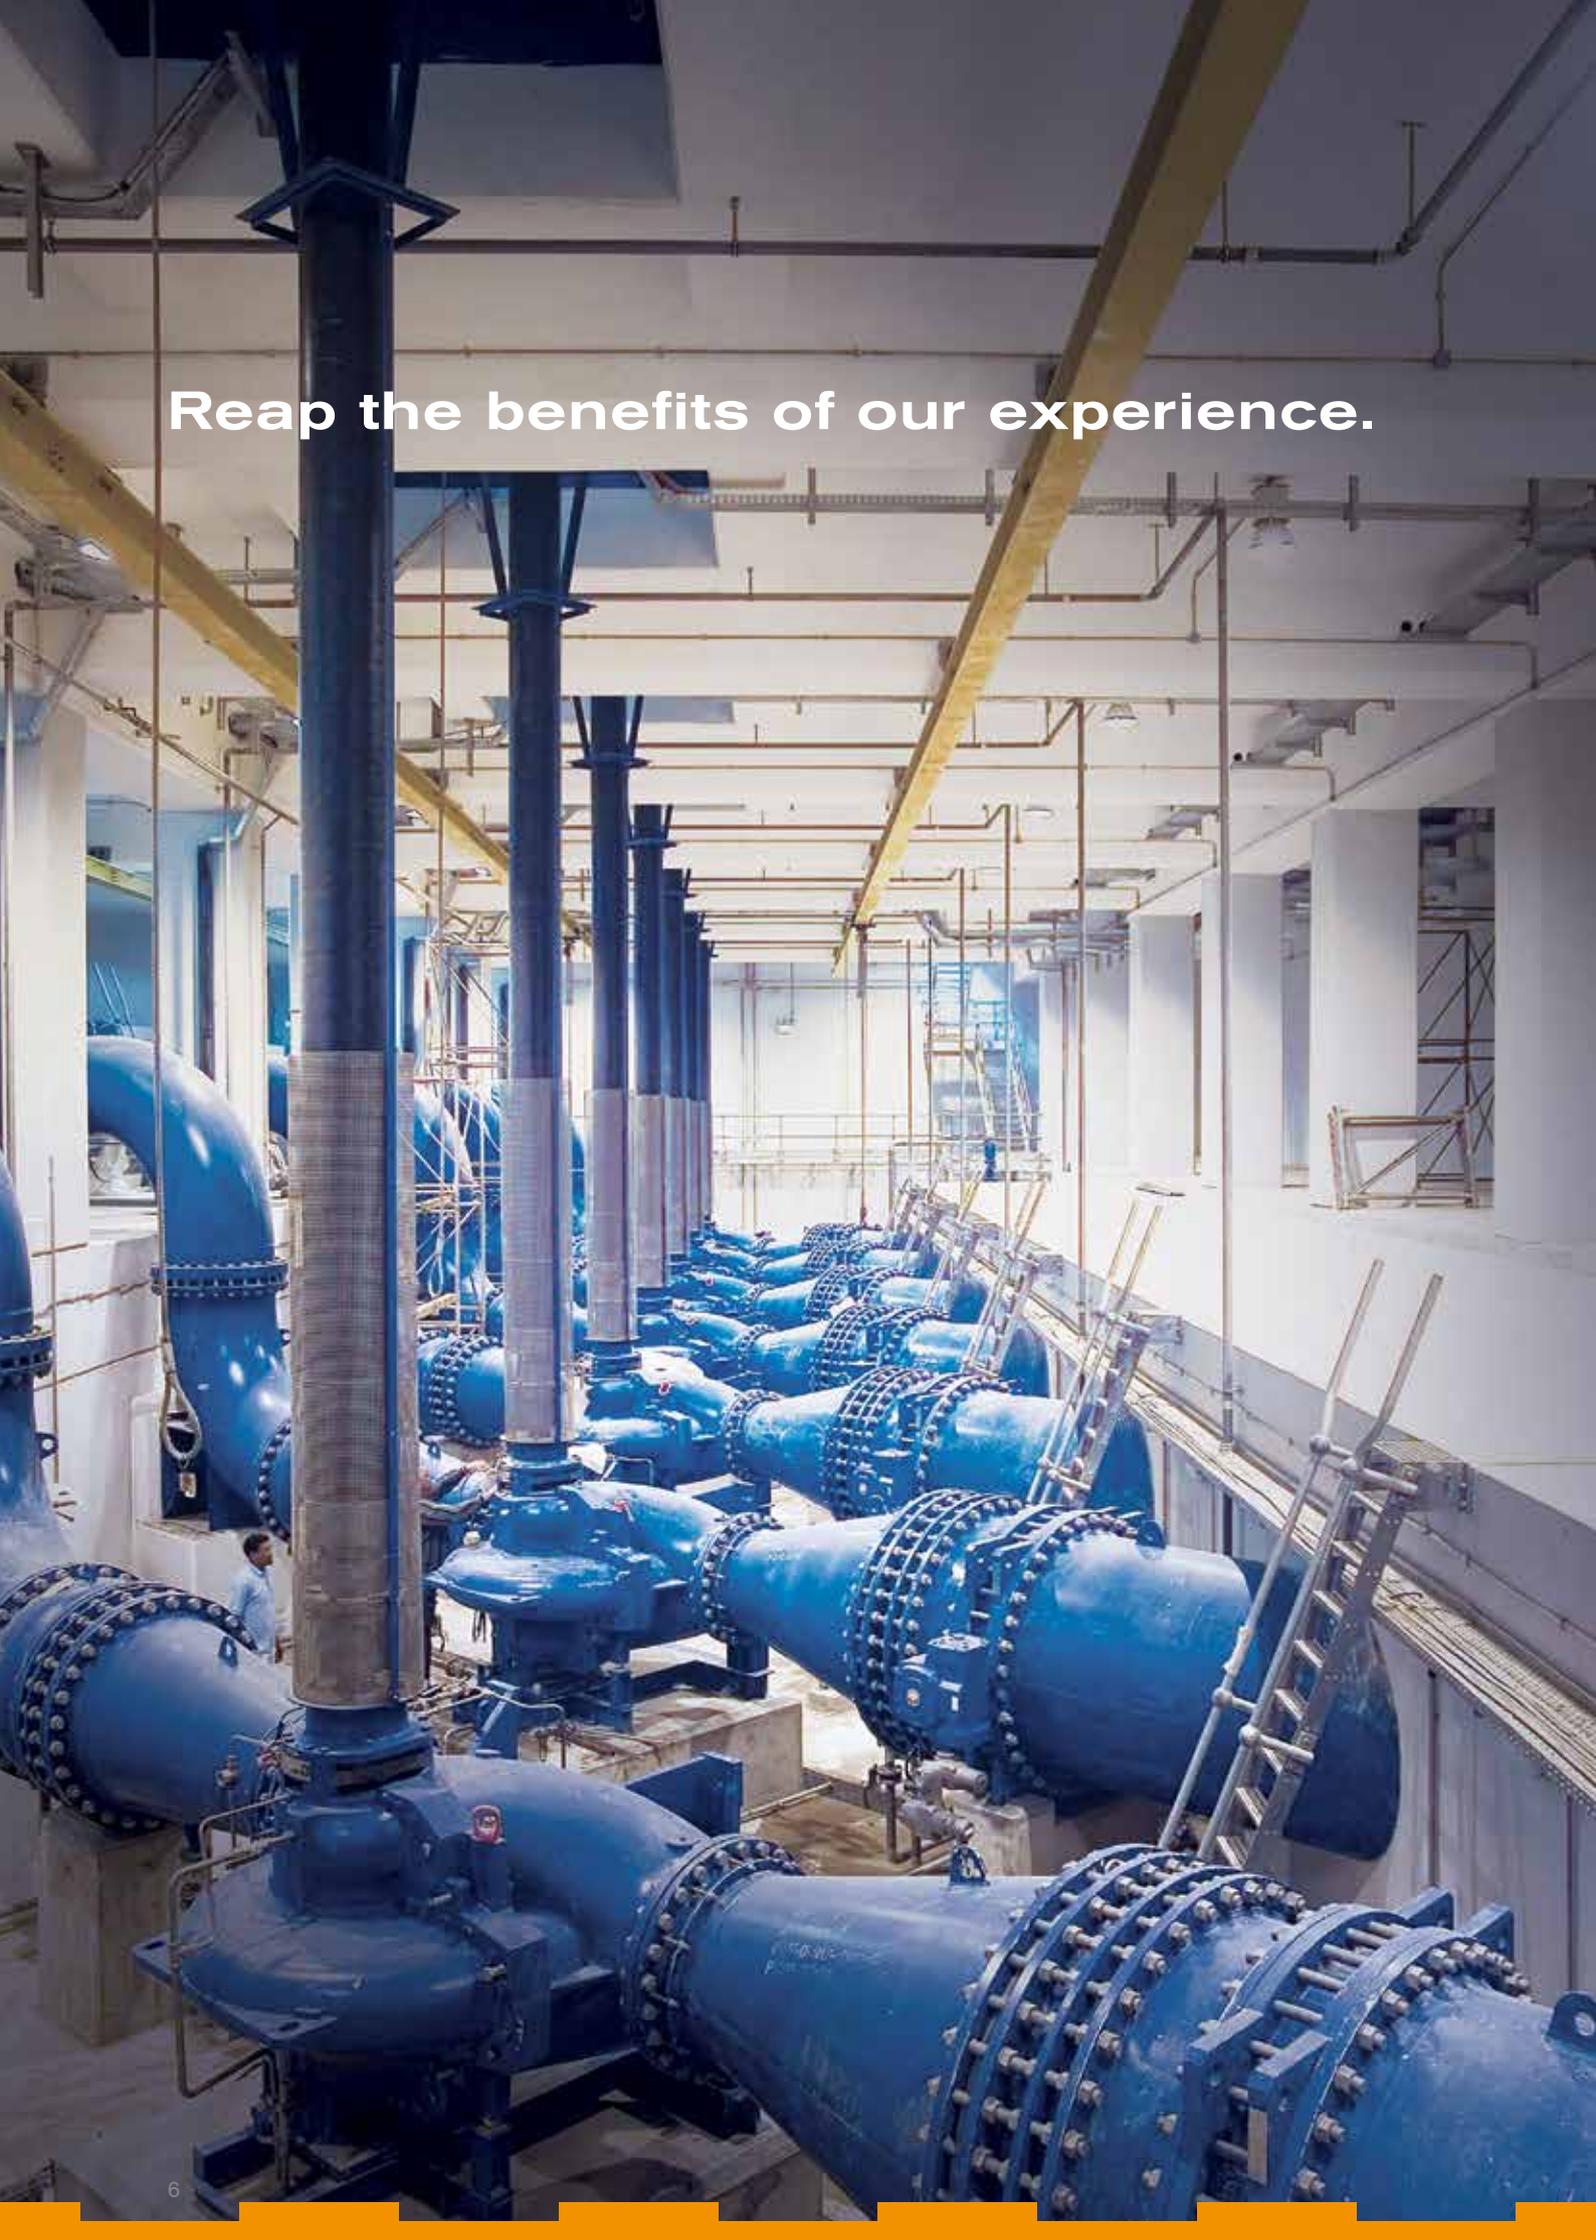

If you can't find what you are looking for, however, we see that as a personal challenge. Because we don't just want to be suppliers to our customers but problem solvers, too. This includes finding the best, most cost-effective solutions for custom applications. Or to express it in numbers: KTR develops more than 20,000 new products and product variants every year on behalf of its clients. And believe us: that includes the coupling that drives your pump at maximum performance.

If you want professional advice even in the planning phase: no problem. Our trained sales staff and application engineers will support you right from the start. In addition, a wealth of information about our products, a CAD library, assembly instructions and much more are freely available at www.KTR.com. All it takes is one click.

If you need standard products for your pumps or compressors, taking a look at our website will help you, too. Simply use the calculation program to determine which size of coupling is right for your application, and place your order for the desired date. The fact that this all runs smoothly is thanks to our SAP data hub which allows direct communication with other systems, thus ensuring short response times, including for orders. The rest is then taken care of by the KTR logistics centre which controls the entire flow of goods using radio-controlled barcode scanning. And even once the items are on their way, you are still in control of everything: with the track-and-trace system, you can check the status (or rather, the delivery) of your items at any time.

Reap the benefits of our experience.

From specialists and experts

Competent, customised advice, right from the outset. We have introduced Industry Market Managers e.g. to assist our clients in the pump industry who purchase all their couplings from one source. In practice, this means a specialist is assigned to you as your direct contact person. And for additional support, a whole host of KTR experts work on your specific development project. And this commitment can be seen all over the world. KTR's international presence in all important industrial markets ensures that users around the globe receive support fast whenever it is needed.

From standard to tailor-made

You have the pump, we have the coupling. Either as a standard product, available ex stock, or as a custom-developed design. The compact, maintenance-free KTR couplings do an outstanding job in any type of pump. Possible applications range from small water pumps to enormous irrigation systems, from the tiniest aspirators to the most powerful turbines. But KTR couplings also provide long-lasting connections in nuclear power plants, in LCD manufacture and in isocyanate foaming processes.

Have confidence in our quality control.

Of quality and safety

We are convinced of the quality of our products. Now we know, of course, that this view of things is not always entirely objective. That is why we also have this impression verified by independent third parties: our quality management was already certified according to ISO 9001 in 1993. In addition to the quality, safety and environmental compatibility of our couplings, this certification incidentally also put all the necessary preparatory work under the microscope: from correct design of the products to reliable processing of orders.

KTR also holds the type examination tests of all major classification societies; in addition, our couplings meet the special requirements of the pump industry, in particular API 610, 671 and 685.

You see, you know you're safe with KTR products. Even when they are being used in potentially explosive atmospheres. In line with European Directive 94/9/EC – better known as ATEX 95 – KTR has arranged for key models in its overall range to undergo certification by an independent institute to assess their suitability for use in potentially explosive atmospheres.

Turbo compressors – when everything turns on maximum performance.

Gas and steam turbines, turbo compressors and generators all have one particular thing in common: they achieve extremely high speeds. Because large forces must be mastered at the same time, couplings are subjected to loads from two sides. The KTR solution: high-strength steels which enable the couplings to be designed so that they are as light and compact as possible. Because the larger the diameter, the higher the circumferential speed. And that results in loads that KTR would rather avoid in the first place.

KTR also avoids vibrations caused by an imbalance – after all, the drives are often used in highly sensitive areas. To prevent these vibrations from building up, KTR carries out precision work right from the outset: we place particular importance on good, precise production and balancing.

One coupling that combines all these benefits is the RIGIFLEX®-HP high-performance coupling. It even bears its performance credentials in its name and has been developed specifically for use in high-speed drivetrains. In other words, at 1,000 cubic metres of air per second, 10,000 revolutions per minute and 500 bars of pressure, this torsionally rigid and low-maintenance all-steel coupling is not stretched to its limits; rather, it is in its element. It combines optimum rigidity with maximum flexibility and is therefore the first choice for nuclear plant and energy technology, in petrochemistry and marine technology, in mining and tunnel construction.

Full power – even under pressure

High-performance compressors often contain high-density air – in extreme cases up to 500 bar. As a result, extreme loads and high torques can occur, particularly when the system starts up. These must be expertly absorbed in order to protect the entire system from damage – a task that the RIGIFLEX®-HP masters perfectly. As stable as possible and as flexible as necessary – in reciprocating, screw or pendulum compressors, industrial gas or process air compressors, plunger or turbo compressors, it is responsible for two things at the same time: it produces and withstands pressure.

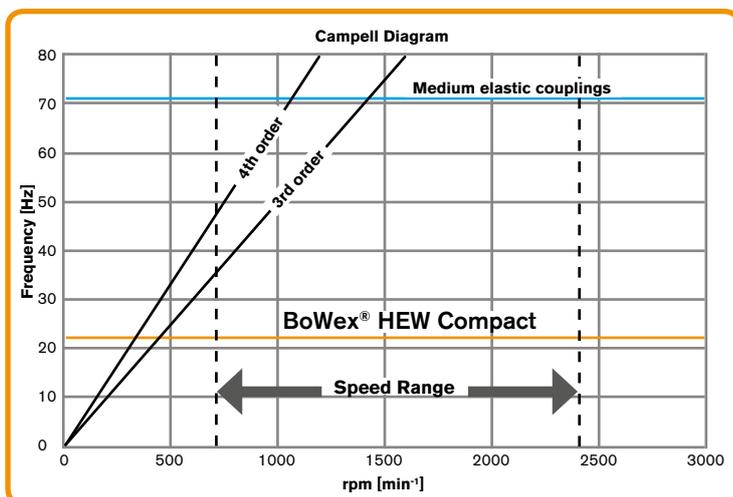

Stationary compressors: power when it's needed.

Either 'off' or on 'full power' – these days, traditional industrial power transmission technology often still works at these two extremes. One thing is increasingly coming to attention, however: consistent revolution at maximum speed results in extreme life-cycle costs. With the result that, in industrial applications, fixed-speed drives are increasingly being replaced with variable-speed drives. The advantages of VSDs (variable-speed drives) are obvious: an industrial compressor that generates only as much compressed air as is really needed often operates at a correspondingly lower speed. And this not only reduces energy consumption but life-cycle costs, too.

Although it sounds so simple, this requires a rethink and a new approach from the point of view of coupling technology. Because the shaft couplings that are used here go through

a much wider range of speeds and can begin to resonate. When choosing the right coupling, it is therefore essential to ensure that the natural frequency of the coupling is outside the range of speeds at which the drive operates.

Obviously a job for the BoWex® HEW Compact. The elastomer coupling, which is vulcanised from natural rubber, reliably damps the torsional vibrations arising in the drivetrain and in the process reduces the forces that accumulate. Moreover, it also compensates for the usual axial and radial shaft displacements and thus contributes significantly towards ensuring that the adjacent components in the drivetrain are not subjected to torque peaks. And because good things always come in threes: thanks to the ability to connect them axially, installing the BoWex® HEW Compact is an easy feat.

Real model calculation for a screw compressor system – the Campell diagram presents the simulation results of the resonance points

Vacuum pump: setting to work with a breath of fresh air.

Quite why the vacuum pump is called a pump, even though it is technically a compressor that runs backwards, we can't tell you. What we can tell you with certainty, however, is that when you come to us you will find the perfect drives for this compressor, too.

Whether it's in the packaging industry or in pneumatic conveyance, for preserving goods or for extracting gases and liquids: vacuum pumps are frequently produced in high quantities. To optimise manufacturing costs they have an extremely compact design, which can result in intense heat development. The solution: KTR provides a breath of fresh air. Couplings with moulded-on fans enable the necessary air circulation by virtue of the fans removing the warm air directly from the housing by means of a heat exchanger.

Portable compressors: momentum without vibration.

No power? No problem! Wherever the infrastructure does not allow for an electricity supply, portable compressors provide the necessary pressure. In civil engineering or in road construction, in quarries or in blasting work, powerful diesel engines reliably power pneumatic tools, pumps and sandblasting equipment.

In this situation, a portable compressor places very high demands on the mounted components. On the one hand, because of the vibrations generated by the internal combustion engine. And on the other hand, because today's compressor screws have a large inertia and often require an additional gear stage to achieve higher rotational speeds. And that places the coupling under high load, particularly when starting up. In order to absorb these and other shock loads, KTR provides highly elastic couplings which damp the oscillations and can absorb vibrations. This therefore minimises the loads in the drivetrain and significantly extends the service life of adjacent components.

However, KTR calculates before it gets that far. And really well, too. A vast range of different factors are taken into consideration in the so-called Torsion Vibration Analysis (TVA): the resonance range of the coupling, its performance at extremes of temperature, the transmission of vibrations from the internal combustion engine, the moments of inertia of the engine and compressor screw, and much more. The appropriate coupling and the way of adapting it to the construction are then selected on the basis of this sophisticated, computer-based analysis of torsional vibration.

The coupling, which has been designed specifically for elastic torque transmission in drives at risk of torsional vibration, is the BoWex-ELASTIC®. It is highly torsionally elastic and combines the advantages of the proven BoWex® system in a compact design with the option of an axial plug assembly within the curved toothing. Torsional vibrations and shock loads are damped and reduced. The coupling also enables misalignments to be compensated – radially, angularly, axially – whilst maintaining extremely low restoring forces.

The full programme for the best possible drive.

Are you looking for the right drive for a pump? Or for a compressor? You are sure to find it at KTR. KTR offers a comprehensive product range of elastic and torsionally rigid couplings to keep your products reliably in motion.

For pumps:

- The torsionally elastic jaw coupling ROTEX®.
- The ROTEX® ZS-DKM-H whose double-cardan design has been specially developed for pump drives.
- The compact, torsionally elastic jaw coupling POLY-NORM®.
- The non failsafe POLY coupling.
- The backlash-free, torsionally rigid steel lamina couplings RADEX®-N and RIGIFLEX®-N. These comply with API 610 or 671 and, thanks to their all-steel design, permit temperatures of between -30 and +280 degrees.
- The permanent-magnet coupling MINEX® which is used for contactless torque transmission in pumps for aggressive and toxic media.
- The DATAFLEX® which has proven itself both in development and quality assurance as precision measuring equipment.

For portable compressors:

- The highly elastic flange coupling BoWex-ELASTIC®.
- As MMC coolers, e.g. as oil coolers and charge-air coolers in a housing.
- The DATAFLEX® torque measurement shaft for reliably determining resonance points in testing.

For stationary compressors:

- The ROTEX® for screw compressors with a constant speed.
- The BoWex® HEW Compact for driving screw compressors with a variable speed.
- The RADEX®-N and RIGIFLEX®-N for multistage compressors.

For LNG and turbo compressors:

- The RIGIFLEX®-HP high-performance coupling with adjusted centre of gravity and optimised torsional rigidity.

For vacuum pumps:

- The ROTEX® and ROTEX® FNN couplings with or without integrated fan impeller.
- The POLY-NORM® jaw coupling with NBR elastomer.
- The BoWex® HEW Compact as a highly elastic coupling.

The specialist solutions for individual applications

Single-cardan couplings have a wide range of applications. But they also have their limits. If compensation of a large shaft offset is necessary in order to convey heated media, this can only be done by double-cardan couplings, e.g. by the ROTEX® ZS-DKM-H. This spacer coupling can also be installed and uninstalled in no time: the shell hubs are reliably held by just four screws.

Unique, yet versatile: thanks to the wide choice of gear elastomers, the ROTEX® jaw coupling can easily be adapted to a vast range of different requirements. The new materials are extremely durable and are characterised by very high temperature resistance and excellent wear resistance.

We can also provide special design for our steel lamina couplings RADEX®-N and RIGIFLEX®-N by utilising new technologies. Thanks to high-strength GRP or CRP spacers, larger shaft distances can be bridged. And without any weight problems either – ideal for large pumps in irrigation systems.

If the torques reach very high levels, the torsionally elastic and fail-safe pin and bush coupling REVOLLEX® KX-D is the ideal connection. It can be used at up to 1,220 kNm, connected axially and is extremely compact. It compensates axial, radial and angular shaft offsets alike and its elastomer rings are resistant to gasoline and oils.

Two become one: a unique design feature of the BoWex® GT is its split sleeve composed of two half-shells, which completely simplifies disassembly for maintenance purposes. At the same time, thanks to the double-cardan principle, the BoWex® GT has a considerably greater capacity for radial misalignment than conventional products.

The ROTEX® SP

The ROTEX® is always characterised by small dimensions, low weight and low inertia whilst at the same time having high torque transmission. The precise, all-over machining has a positive effect on the running characteristics and significantly increases the service life of the coupling. As the newly developed ROTEX® SP, it is also zero maintenance in potentially explosive atmospheres and is fail-safe but non-sparking.

PRODUCT OVERVIEW FOR PUMPS AND COMPRESSORS

					
Couplings		ROTEX®	ROTEX® SP	RADEX®-N	RIGIFLEX®-N
